Today’s Visit

**QUESTIONS TO ASK**

USE THIS GUIDE TO HELP YOU GATHER THE INFORMATION YOU NEED FROM YOUR DOCTOR.

- What tests will you use to figure out the source of my inflammation?

- Will I need to go on an elimination diet?

- What treatments are available for EoE?

- At what point is surgery necessary?

- When should I call you?

- Treatments I’ve tried:

GETTING TO THE BOTTOM OF IT

ANSWERS TO THESE QUESTIONS CAN HELP YOUR DOCTOR BETTER UNDERSTAND HOW YOUR EoE IS AFFECTING YOU.

Do particular foods seem to trigger your trouble swallowing?

- yes
- no

Which foods?

Have you kept a symptom diary?

- yes
- no

Does anything improve your ability to swallow?

- yes
- no

What is it?

How often do you struggle with swallowing?

- yes
- no

Have you tried any treatments?

- yes
- no

Did they work?

Talk to your doctor about options.

- yes
- no

Do you have symptoms every day?

- yes
- no

Do they affect every meal?

How often do you have them?

- yes
- no

If you start having new or worsening pain when you swallow, are vomiting up your food more often, or have to go to the hospital for an obstruction, TALK TO YOUR GASTROENTEROLOGIST AS SOON AS POSSIBLE. DON’T WAIT UNTIL YOUR NEXT CHECKUP TO CHECK IN.

CRAIG C. REED, MD, GASTROENTEROLOGIST AND ASSISTANT PROFESSOR OF MEDICINE AT THE UNIVERSITY OF NORTH CAROLINA SCHOOL OF MEDICINE IN CHAPEL HILL
DIFFICULTY WITH EoE?
(EOSINOPHILIC ESOPHAGITIS)
DUPIXENT CAN IMPROVE SWALLOWING

Based on clinical trials with 240 adult and pediatric patients (12+ years weighing at least 88 lbs) with EoE at Week 24.

INDICATION
DUPIXENT is a prescription medicine used to treat adults and children 1 year of age and older with eosinophilic esophagitis (EoE), who weigh at least 33 pounds (15 kg). It is not known if DUPIXENT is safe and effective in children with eosinophilic esophagitis under 1 year of age, or who weigh less than 33 pounds (15 kg).

IMPORTANT SAFETY INFORMATION
Do not use if you are allergic to dupilumab or to any of the ingredients in DUPIXENT.
Before using DUPIXENT, tell your healthcare provider about all your medical conditions, including if you:
- have a parasitic (helminth) infection.
- are scheduled to receive any vaccinations. You should not receive a “live vaccine” right before and during treatment with DUPIXENT.
- are pregnant or plan to become pregnant. It is not known whether DUPIXENT will harm your unborn baby. o A pregnancy registry for women who take DUPIXENT during pregnancy collects information about the health of you and your baby. To enroll or get more information call 1-877-311-8972 or go to https://mothertobaby.org/ongoing-study/dupixent/.
- are breastfeeding or plan to breastfeed. It is not known whether DUPIXENT passes into your breast milk.
- are taking oral, topical, or inhaled corticosteroid medicine or other asthma medicine without talking to your healthcare provider.
- are scheduled to receive any vaccinations. Your healthcare provider may stop DUPIXENT if you develop joint symptoms.
- are scheduled to receive any vaccinations. You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch, or call 1-800-FDA-1088.
- have a parasitic (helminth) infection.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins and herbal supplements.
Especially tell your healthcare provider if you are taking oral, topical, or inhaled corticosteroid medicines or if you have EoE and asthma and use an asthma medicine. Do not change or stop your corticosteroid medicine or other asthma medicine without talking to your healthcare provider.
This may cause other symptoms that were controlled by the corticosteroid medicine or other asthma medicine to come back.

IMPORANT SAFETY INFORMATION cont’d
DUPIXENT can cause serious side effects, including:
- Allergic reactions. DUPIXENT can cause allergic reactions that can sometimes be severe. Stop using DUPIXENT and tell your healthcare provider or get emergency help right away if you get any of the following signs or symptoms: breathing problems or wheezing, swelling of the face, lips, mouth, tongue or throat, fainting, dizziness, feeling lightheaded, fast pulse, fever, hives, joint pain, general ill feeling, itching, skin rash, swollen lymph nodes, nausea or vomiting, or cramps in your stomach-area.
- Joint aches and pain. Some people who use DUPIXENT have had trouble walking or moving due to their joint symptoms, and in some cases needed to be hospitalized. Tell your healthcare provider about any new or worsening joint symptoms. Your healthcare provider may stop DUPIXENT if you develop joint symptoms.

The most common side effects in patients with eosinophilic esophagitis include:
- injection site reactions, upper respiratory tract infections, cold sores in your mouth or on your lips, and joint pain (arthritis).

Tell your healthcare provider if you have any side effect that bothers you or that does not go away. These are not all the possible side effects of DUPIXENT. Call your doctor for medical advice about side effects. You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch, or call 1-800-FDA-1088.
Use DUPIXENT exactly as prescribed by your healthcare provider. It’s an injection given under the skin (subcutaneous injection). Your healthcare provider will decide if you or your caregiver can inject DUPIXENT. Do not try to prepare and inject DUPIXENT until you or your caregiver have been trained by your healthcare provider. In children 12 years of age and older, it’s recommended DUPIXENT be administered by or under supervision of an adult. In children 1 to less than 12 years of age, DUPIXENT should be given by a caregiver.

Please see Brief Summary of Prescribing Information on next page.

© 2024 Sanofi and Regeneron Pharmaceuticals, Inc.
Especially tell your healthcare provider if you:

• are taking oral, topical, or inhaled corticosteroid medicines
• have EoE and asthma and use an asthma medicine

Do not change or stop your corticosteroid medicine or other asthma medicine without talking to your healthcare provider. This may cause other symptoms that were controlled by the corticosteroid medicine or other asthma medicine to come back.

How should I use DUPIXENT?

• See the detailed “Instructions for Use” that comes with DPUIXENT for information on how to prepare and inject DPUIXENT and how to properly store and throw away (dispose of) used DPUIXENT pre-filled syringes and pre-filled pens.
• Use DPUIXENT exactly as prescribed by your healthcare provider.
• Your healthcare provider will tell you how much DPUIXENT to inject and how often to inject it.
• DPUIXENT comes as a single-dose pre-filled syringe with needle shield or as a pre-filled pen.
• DPUIXENT is given as an injection under the skin (subcutaneous injection).

If your healthcare provider decides that you or a caregiver can give the injections of DPUIXENT, you or your caregiver should receive training on the right way to prepare and inject DPUIXENT.

Do not inject DPUIXENT until you have been shown the right way by your healthcare provider. In children 12 years of age and older, it is recommended that DPUIXENT be given by or under supervision of an adult.

If your dose schedule is every week and you miss a dose of DPUIXENT: Give the DPUIXENT injection as soon as possible and start a new every week dose schedule from the time you remember to take your DPUIXENT injection.

If you inject too much DPUIXENT, call your healthcare provider or Poison Help line at 1-800-222-1222 or go to https://motherofbaby.org/ongoing-study/dupixent/.

• are breastfeeding or plan to breastfeed. It is not known whether DPUIXENT will harm your unborn baby.

– Pregnancy Exposure Registry. There is a pregnancy exposure registry for women who take DPUIXENT during pregnancy. The purpose of this registry is to collect information about the health of you and your baby. Your healthcare provider can enroll you in this registry. You may also enroll yourself or get more information about the registry by calling 1-877-517-9764 or going to https://motherofbaby.org/ongoing-study/dupixent/.

• Do not keep DPUIXENT and all medicines out of the reach of children.

What is DPUIXENT?

• DPUIXENT is a prescription medicine used:
  • to treat adults and children 1 year of age and older with eosinophilic esophagitis (EoE), who weigh at least 33 pounds (15 kg).
  • DPUIXENT works by blocking two proteins that contribute to a type of inflammation that plays a major role in EoE.
  • It is not known if DPUIXENT is safe and effective in children with EoE under 1 year of age and who weigh at least 33 pounds (15 kg).

Who should not use DPUIXENT?

Do not use DPUIXENT if you are allergic to dupilumab or to any of the ingredients in DPUIXENT. See the end of this summary of information for a complete list of ingredients in DPUIXENT.

What should I tell my healthcare provider before using DPUIXENT? Before using DPUIXENT, tell your healthcare provider about all your medical conditions, including if you:

• have eye problems.
• have a parasitic (helminth) infection.
• are pregnant or plan to become pregnant. It is not known whether DPUIXENT will harm your unborn baby.
• breastfeed or plan to breastfeed. It is not known whether DPUIXENT passes into your breast milk.

Tell your healthcare provider about all of the medicines you take including prescription and over-the-counter medicines, vitamins, and herbal supplements.

What are the possible side effects of DPUIXENT?

DPUIXENT can cause serious side effects, including:

• Allergic reactions. DPUIXENT can cause allergic reactions that can sometimes be severe. Stop using DPUIXENT and tell your healthcare provider or get emergency help right away if you get any of the following signs or symptoms: breathing problems or wheezing, swelling of the face, lips, mouth, tongue, or throat, fainting, dizziness, feeling lightheaded, fast pulse, fever, hives, joint pain, general ill feeling, itching, skin rash, swollen lymph nodes, nausea or vomiting, or cramps in your stomach-area.

• Joint aches and pain. Joint aches and pain can happen in people who use DPUIXENT. Some people may have trouble walking or moving due to their joint symptoms, and in some cases needed to be hospitalized. Tell your healthcare provider about any new or worsening joint symptoms. Your healthcare provider may stop DPUIXENT if you develop joint symptoms.

The most common side effects of DPUIXENT in patients with atopic dermatitis include:

• injection site reactions, upper respiratory tract infections, cold sores in your mouth or on your lips, and joint pain (arthralgia).

The following additional side effects have been reported with DPUIXENT: facial rash or redness. Tell your healthcare provider if you have any side effect that bothers you or that does not go away. These are not all of the possible side effects of DPUIXENT.

Call your doctor for medical advice about side effects. You may report side effects to FDA. Visit www.fda.gov/medwatch, or call 1-800-FDA-1088.

How should I store DPUIXENT?

• Store DPUIXENT in the refrigerator at 36°F to 46°F (2°C to 8°C).
• Store DPUIXENT in the original carton to protect from light.
• DPUIXENT can be stored at room temperature up to 77°F (25°C) up to 14 days. Throw away (dispose of) any DPUIXENT that has been left at room temperature for longer than 14 days.

General information about the safe and effective use of DPUIXENT. Medicines are sometimes prescribed for purposes other than those listed in this Patient Information leaflet. Do not use DPUIXENT for a condition for which it was not prescribed. Do not give DPUIXENT to other people, even if they have the same symptoms that you have. It may harm them.

This is a summary of the most important information about DPUIXENT for this use. If you would like more information, talk with your healthcare provider. You can ask your pharmacist or healthcare provider for more information about DPUIXENT that is written for healthcare professionals.

For more information about DPUIXENT, go to www.DUPIXENT.com or call 1-844-DUPIXENT (1-844-387-4936).

What are the ingredients in DPUIXENT? Active ingredient: dupilumab

Inactive ingredients: L-arginine hydrochloride, L-histidine, polysorbate 80, sodium acetate, sucrose, and water for injection

Manufactured by: Regeneron Pharmaceuticals, Inc., Tarrytown, NY 10591

U.S. License # 1760; Marketed by sanofi-aventis U.S. LLC, Bridgewater, NJ 08807 and Regeneron Pharmaceuticals, Inc. (Tarrytown, NY 10591)

Maybe Less is More

If you’ve tried it, you know that the six-food elimination diet for EoE is no easy feat! But new research shows that cutting dairy alone may be just as effective.

In a study, 129 adults with EoE ages 18 to 60 dropped dairy for 6 weeks. Half of them also quit wheat, soy, eggs, nuts, and seafood. In the dairy-only group, 40% went into remission. In the six-food group, 34% hit that mark. The two groups saw similar improvements in symptoms and quality of life, too. If you’re considering an elimination diet, you might want to start with just dairy.

SOURCE: The Lancet Gastroenterology and Hepatology

Cause for Hope

Because EoE is considered a relatively new disease, scientists are still trying to understand the body processes behind it. In 2022, the FDA approved the first drug to treat this condition. It blocks certain substances in the body that cause the inflammation involved in EoE. Research suggests this may be just the tip of the iceberg. Studies currently underway examine more than half-a-dozen other molecules in the body that also promote EoE. The results could bring more options to people living with this condition in the coming years.

SOURCE: Current Opinion in Pharmacology

Non-Food Triggers of EoE

Some people resort to extremely limited diets to try to control their EoE and still get no relief. But food allergies may not be the only trigger of this condition. Recent research analyzed numerous studies of potential EoE triggers and causes. In some people, seasonal allergies may be to blame. In these cases, eliminating exposure to seasonal allergens, such as grass, pollen, and mold, resolves EoE. Researchers have also noted that more people may get diagnosed with EoE in the spring and summer, when these allergens are active, and that disease severity seems to be greatest at this time of year, too.

150,000

ESTIMATED NUMBER OF PEOPLE in the U.S. who have EoE.

SOURCE: JAMA
Q. What is eosinophilic esophagitis (EoE)?
It’s considered a rare disease, but it’s probably more common than we think. It happens when white blood cells called eosinophils build up in the esophagus and cause inflammation. If left untreated, it progresses and slowly narrows the esophagus over many years and causes difficulty swallowing solid food.

Q. What causes EoE?
The whole picture is still unclear. It’s likely a combination of genetics and things that you are exposed to in the environment and certain foods. The general consensus as to what ultimately triggers the disease is an allergic reaction.

Q. What are the symptoms?
The hallmark of the disease is difficulty swallowing solid food and choking on food. For a few years, you may just write it off as “I just didn’t chew my food carefully,” “I ate too fast,” “I should drink some water.” Then you start accommodating so you can eat problematic foods—usually foods that go down in a glob like meat, rice, and bread. You cut it into smaller pieces. You chew more carefully.

Eventually, eating becomes so uncomfortable that you seek care. Or food gets stuck in your esophagus—it won’t go up or down—and you go to the emergency room.

Q. What is the treatment for EoE?
First, you might try an acid reflux medicine called a proton pump inhibitor. They reduce inflammation in the esophagus for about 50% of people who have EoE, so they just take it for the rest of their life.

The next option is a swallowed steroid you get through an asthma inhaler or in liquid form.

Third is an elimination diet. A diet that removes eggs, dairy, wheat, peanuts, soy, fish, and shellfish helps 40% to 50% of people. But every time you add a food back in to see if you can tolerate it, you have to do an endoscopy to make sure it’s not affecting the esophagus. That’s six to seven endoscopies within a year. So now we tell people to try to eliminate just gluten and dairy. If they do well, they can stay on it. If not, we can try something else.

If other treatments fail, we have a new FDA-approved drug. It’s a biologic agent used to treat several allergic diseases. And it’s a weekly injection you give yourself at home.
AN INSIDE LOOK AT
EOSINOPHILIC ESOPHAGITIS

By Kendall K. Morgan | Reviewed by Neha Pathak, MD, WebMD Lead Medical Editor

Good To Know

The lining of a healthy esophagus is made of a thin layer of cells and should be pink, flat, and regular.

1 Normal Esophagus
Your esophagus is a long, muscular tube that sends food and water through your neck and chest into your stomach.

2 Normal Esophagus Epithelium

Stomach
Duodenum
In EoE, eosinophils build up in the lining of your esophagus, causing damage to your esophageal epithelium. When left unchecked, this damage leads to fibrosis. Instead of being flat and smooth, your esophagus may narrow in places, forming irregular rings that make swallowing hard.

**Eosinophilic Esophagitis (EoE)**

**Eosinophils**
A special type of immune cell involved in inflammation and allergic disorders.

**Irritation, Fibrosis, Narrowing**
When your body tries to heal damaged tissue and leaves abnormally thick, stiff, scarred tissue behind.

**SOURCES:** The Human Protein Atlas, GERD.org, Cincinnati Children’s, Mayo Clinic, Cleveland Clinic

**Illustration by Iris Johnson**
When you have eosinophilic esophagitis (EoE), it’s a good idea to take immediate steps to prevent permanent damage to your esophagus, says Michael S. Smith, MD, a gastroenterologist at Mount Sinai in New York City. To help you, follow these tips.

**Tip No. 1: Work With Your Doctor**
Talk with your doctor about your treatment options, which may include changes in your diet, taking medicines, or having a medical procedure to stretch your esophagus.

“It is very likely you will need ongoing treatment for EoE, so make sure you have a good relationship with your physician and share openly what is and is not working for you with respect to your care plan,” Smith says.

**Tip No. 2: Adjust Your Eating Habits**
Smith recommends cutting your food into smaller pieces and making sure that you chew your food well. Drink water regularly while you eat to help push your food along. These steps can help you to avoid a blockage in your esophagus that could send you to the emergency room.

**Tip No. 3: Consider Your Diet**
EoE is often related to foods, most commonly including dairy, wheat, eggs, soy, nuts, and shellfish. Try an elimination diet (see page 17) with guidance from your care team to help you identify any food triggers.

**Tip No. 4: Ask About Allergy Testing**
Many people with EoE have a history of allergies or allergic conditions, such as atopic dermatitis (eczema) or food allergies. Ask your doctor if they recommend allergy testing. Keep in mind that you can still have EoE even if you don’t have any known allergies, Smith says.

**Tip No. 5: Let Friends and Family Know**
Your EoE and its symptoms may cause you to avoid eating around other people or to feel self-conscious when you do. It can help to tell friends and family about your EoE and the ways it’s affecting you.

“It’s OK to be the last to finish a meal and to take your time and not feel rushed,” Smith says. “If people around you don’t know you have to do that, they can’t be as supportive of you as you work through your condition.”
“When monitoring your EoE, you want to pay attention to how difficult it is to swallow food and liquid at each meal,” says Bryan G. Sauer, MD, gastroenterologist in the Digestive Health Center at UVA Health in Charlottesville, VA. “How often do you have trouble swallowing? Are you doing anything to get foods down easier? Are you avoiding certain foods or social situations because of your symptoms? This overview helps your doctor get a clearer picture of how best to treat you.”

SCAN OR COPY THIS PAGE BEFORE YOU FILL IT IN TO USE FOR TWO OR THREE MONTHS
I’m the youngest of three girls in my family. My oldest sister has severe food allergies. My middle sister and I both have eosinophilic esophagitis (EoE). Life has been tough, but we’ve managed to find our way.

Growing up with EoE

I was a little over 1 year old when I started vomiting and losing a lot of weight. I once threw up on my poor dad! I was diagnosed with EoE soon after that. My parents made sure I knew how to take a role in my health. I was changing my feeding tubes and correcting those who did it wrong. I’m glad I didn’t have to play catch-up with learning that after I graduated. At this point, I’m familiar with endoscopies, feeding tubes, and how to explain EoE. Knowing how the disease works and how to take an active role in your health is key.

Still, as soon as you get used to one thing, your body can change. When I started middle school, my diet was less restrictive and then I just crashed! I lost my ability to eat and had to go back to using my feeding tube. My friends were so sweet. They knew I couldn’t eat at lunch so they’d let me open their food and pass it around to them. I couldn’t do everything my friends did, but I found ways to stay included. You have to tweak your life so you’re not on the sidelines.

My sister’s keeper

Right when our family was figuring out life, we had another twist. My middle sister, Abby, was diagnosed with EoE. She was 6 and was used to changing my feeding tubes. But it was tough for her. She was used to eating all types of foods and had to stop. We joke about who had it worse: me with virtually no food from the beginning or her starting and then having to stop certain foods!

My health has made me shy. Other than my sisters, I’ve had one best friend and she has a heart condition. My friends might have bonded over jump rope and dolls. My sister and I attended doctor’s appointments and endoscopies together. We had our secret games and jokes. I’m incredibly
fortunate to be so close to someone who “gets it.” For people who don’t have that, I encourage them to find a support system of other people with EoE. It’s been sad to bond over this but helpful to have someone to go through it with. And since I’ve had it longer, I get to be the big sister sometimes!

The new me

These days, I’m in a good place. It’s been a hard journey, and at times, I didn’t think I’d ever get here. I’ve learned to set limits: for example, deciding not to take advanced placement (AP) classes despite qualifying. It was the best decision for me. A month before my graduation, I was cleared to remove my feeding tube. It felt weird not being a “tubey” after 15-plus years. I even cried!

I’m now in college studying psychology. I want to help other people with the mental impact of having a chronic illness. In my free time, I’m learning about many foods. I didn’t know what spicy was, or tangy, or how to cut meat. It’s all beautifully terrifying. Writing medical poetry has been an outlet for me. I hope others see me and see hope.
GROCERY LIST

HERE’S WHAT YOU SHOULD PICK UP AT THE STORE

By Kendall K. Morgan
Reviewed by Neha Pathak, MD, WebMD Lead Medical Editor

One of the most common ways to treat eosinophilic esophagitis (EoE) is to take the foods that trigger it out of your diet. You might do tests to find out which foods bother you specifically. Sometimes people also try an elimination diet, in which they remove up to six foods that commonly trigger EoE.

These foods to avoid may include:

- Dairy products
- Wheat
- Eggs
- Soy
- Peanuts and tree nuts
- Fish and shellfish

If you need to cross certain foods off your grocery list, what should you buy at the store?

Here’s a good list to keep you eating well and help you replace some of what you’re missing:

- Coconut milk
- Rice milk
- Oat milk
- Hemp milk
- Pea milk
- Rice
- Oats
- Corn
- Quinoa
- Millet
- Buckwheat
- Gluten-free flour
- Beef
- Chicken
- Pork
- Beans, lentils, and chickpeas
- Rice
- Potatoes
- Fruit
- Vegetables
- Coffee
- Tea
- Daily multivitamin
- Vitamin D and calcium-fortified orange juice

You can find lots of resources online for meals and snacks that suit your new diet. Remember when you’re at the store to check food labels for any packaged items on your list to make sure they don’t contain allergens or ingredients you’re eliminating. Don’t rely on claims on the front of a package that say a food is dairy-, nut-, or wheat-free.
ELIMINATION DIET

USE THIS TOOL TO KEEP A RECORD OF YOUR MEALS AND SYMPTOMS.

A typical six-food elimination diet (SFED) for EoE starts with the subtraction of wheat, milk, eggs, nuts, soy, fish, and shellfish. After 6 weeks on the SFED diet, you’ll introduce one of the eliminated foods every 2 to 4 weeks. Using this weekly table, you can record your symptoms to get a better overall picture of how your body reacts to each reintroduced food.

Check in with your doctor as you progress through your elimination diet.

SCAN OR COPY THIS PAGE BEFORE YOU FILL IT IN TO USE FOR TWO OR THREE MONTHS
For most people with EoE, cutting certain foods out of your diet is an effective method for treating your symptoms. Although it can be time-consuming and at times overwhelming, it’s a low-risk choice that can deliver positive results and move you toward a better quality of life. “Not all people with EoE have food allergies that contribute to their symptoms, but at least 80% of cases are induced by food allergens,” says Deepa M. Grandon, MD, an allergist/immunologist at Cleveland Clinic Abu Dhabi, UAE.

Your health care team will help you figure out your trigger foods in a specific way so you know what may be safe and what needs to go for good.

Target food groups

When EoE symptoms happen because of a food allergy, it means certain proteins from those foods trigger an allergic inflammatory response in your esophagus. Certain food groups are more likely to cause this reaction than others. The most common method for food elimination is the six-food elimination diet (SFED). On this diet, you cut the common culprits such as wheat, milk, eggs, nuts, soy, fish, and shellfish completely out of your diet. After 6 weeks, your doctor does an endoscopy and biopsy to see if your
inflammation has gone down.

It can be challenging to give up so many foods at once, so some doctors instead try a modified approach where they focus on only a couple of top offenders first. “We’re finding more and more that patients are more willing to do a step-up type of diet where they eliminate milk and wheat first and then see if their inflammation resolves over time,” says Derek A. Damin, MD, assistant professor of clinical medicine at Vanderbilt University Medical Center in Nashville, TN.

Grandon says that for people who fit the criteria for food elimination, 43% will respond to this smaller change alone.

When to reintroduce

Once the elimination period has passed, your doctor will have you start eating one of the foods you cut out. Then they’ll do certain tests to see how your body responds. Over time, you’ll continue to test each food you’ve eliminated.

“Typically, [you] can find the culprit food within the first meal of reintroduction,” Grandon says.

Your doctor does this by doing an endoscopy and taking a small sample of tissue from your esophagus. Then they check the sample to see if your level of eosinophils—the immune cells that trigger inflammation—has gone down.

“Many times one of the best indicators for a food causing an individual’s inflammation is in their history,” Damin says. “They’ll say, ‘I think dairy has been bothering me over the past months or years,’ and then that will be the culprit.”

WAYS TO ELIMINATE

Deepa M. Grandon, MD, shares the three main dietary restriction strategies for EoE.

1. **Empiric elimination diet**: Take out two to six foods and gradually add back in.

2. **Test-directed diet**: Based on skin or blood allergy test results.

3. **Elemental diet**: Liquid meal replacement.
After an EoE diagnosis, you want the best treatment plan to keep your symptoms under control. And although you want to do what’s necessary, you may also be wondering what these treatments will cost.

Your expenses will vary based on your plan and insurance coverage, but there are ways to approach the financial part of your care with savvy.

**Know the numbers**

Your doctor may start with medications such as proton-pump inhibitors (PPIs) or inhaled steroids, or a biologic, or they may suggest an elimination diet. These options range in cost, and you may try several before finding what works.

Over-the-counter PPIs are inexpensive but generally the least effective treatment for EoE. Prescription steroids are more expensive.

“Typically, one inhaler is more than $300 and you may need two of them per month,” says Evan S. Dellon, MD, MPH, professor of medicine and adjunct professor of epidemiology at the University of North Carolina School of Medicine at Chapel Hill. Other options can be as much as $1,000.

Biologics are the most effective treatment, but costly. You get them from a specialty pharmacy and take them as weekly injections. Although the price can be steep, Dellon says there are forms of help available.

“There are copay assistance programs with the company [that makes the drug],” he says. “It’s actually quite generous, but they’re still the most expensive possible option right now.”

**Expect hidden costs**

Most people with EoE respond well to dietary therapy. In a study, Dellon found that people
following the six-food elimination diet (SFED) added nearly $700 to their yearly grocery bill.

“It’s expensive if all your foods have to be wheat-, dairy-, and egg-free,” he says. “And those estimates were from 2010, so that number might be doubled by now with inflation.”

You may be able to cut some of these costs by talking to a nutritionist, says Elizabeth T. Jensen, MPH, PhD, associate professor of epidemiology and prevention and associate professor of gastroenterology at Wake Forest University School of Medicine in Winston-Salem, NC.

“They can provide information and resources about how to adhere to the diet in a way that is simple and not as costly for you,” she says.

**Compare plans**

One of the best ways to save is to take a hard look at your insurance coverage and see if moving to another plan could reduce overall costs.

“You may need something with a higher monthly premium that’s going to be a lower deductible with better pharmacy coverage.” Dellon says.

Even if you have to pay an extra $100 to $200 a month, it can pay off if you’re facing multiple endoscopies and more expensive medications.

**Check clinical trials**

EoE treatment research is ongoing, and as a result, there are many clinical trial options. Your doctor can help you see if you qualify for any open studies.

“If you’re underinsured or not insured, it’s a great way to get treatments,” Dellon says. “Everything—the endoscopies and medications and all of your care—is paid for.”

**Connect with others**

There are people out there who may have good advice about how to manage therapy costs.

“A lot of patient advocacy groups have a very active social media presence, which can be a way to connect with other families experiencing this and get ideas from their process,” Jensen says. You may want to run their tips by your doctor.

**ELEMENTAL DIET COVERAGE**

States where insurance covers liquid replacement diets for people with severe EoE:

- Arizona
- Connecticut
- Illinois
- Maine
- Maryland
- Massachusetts
- Minnesota
- Nebraska
- New Hampshire
- New Jersey
- New York
- Oregon
- Pennsylvania
- Rhode Island
- South Dakota
- Texas
- Washington
WHAT IS YOUR EoE IQ?
TAKE THIS TRUE/FALSE QUIZ TO FIND OUT

By Kendall K. Morgan
Reviewed by Neha Pathak, MD,
WebMD Lead Medical Editor

1. The main problem when you have eosinophilic esophagitis (EoE) is with your esophagus, the tube that connects your mouth and throat to your stomach.

2. EoE can be cured.

1. False ➤ EoE symptoms do show up in your esophagus. But EoE is a chronic immune system disorder. It happens mainly when your immune system reacts badly to foods that you’re eating. The key to treating EoE is to limit the immune response either with medicine or by eliminating foods that trigger it.

2. False ➤ EoE is a chronic disorder of the digestive system. It’s a major cause of illness that can make it hard to swallow and eat. Doctors are diagnosing EoE more now than ever before at rates that keep going up.

3. False ➤ Acid reflux happens when acid from your stomach comes up into your esophagus. EoE happens from inflammation caused by immune cells called eosinophils. Both conditions can make it hard to swallow and eat. If you have what you think is heartburn but it doesn’t go away with heartburn medicine, you could have EoE. Even though acid isn’t the main problem in EoE, medicines that lower acid in your stomach sometimes can help with EoE. But those medicines don’t really fix the main problem.

4. True ➤ Your doctor can’t tell if you have EoE just by passing a camera and light in a flexible tube down your throat to look at your esophagus in a procedure called an endoscopy. But they will need to do an endoscopy of your esophagus to take biopsy samples. They’ll use a microscope to check for immune cells called eosinophils and other signs of inflammation in small bits of your esophageal tissue.

5. False ➤ Diets that take out major food allergens or foods you have specific sensitivities to can help and are a good way to treat your EoE. But medical treatment may also help manage the condition.
